

SQL: Most Requested Advertising Products Summary

Problem Description

In the advertising industry, staying attuned to client demands and preferences is key to optimizing ad inventory and crafting effective sales strategies. A development team is creating a query to generate a detailed report identifying all the requested advertising products.

This comprehensive report aims to spotlight products currently available for advertising campaigns, offering insights into client interests and guiding inventory management decisions.

Requirements:

- The result must include the columns: name, category, and `total_requests`.
- `total_requests` is the total number of requests made by clients for that specific product.
- **Note:** Only advertising products that are **available** (`is_available = 1`) should be included.

Sorting:

1. Primary sort: `total_requests` in **descending** order.
2. Secondary sort: name in **ascending** order.
3. Tertiary sort: category in **ascending** order.

Database Schema

Table: products

Column	Type	Constraints	Description
--------	------	-------------	-------------

id	INT	PRIMARY KEY	The identifier of the product
name	VARCHAR(255)		The name of the product
category	VARCHAR(255)		The category of the product
is_available	BOOLEAN		Flag indicating if the product is available

Table: requests

Column	Type	Constraints	Description
product_id	INT	FOREIGN KEY	Reference to products.id
client_email	VARCHAR(255)		The email address of the client

Sample Data & Test Cases

Sample products Table

id	name	category	is_available
1	PromoPro	home goods	1
2	AdVantage	beauty products	1
3	MarketMagnet	apparel	0

Sample requests Table

product_id	client_email
1	bsyder0@cnbc.com
1	cvangiffenf@prweb.com
2	arasell2@ox.ac.uk

Expected Output

name	category	total_requests
PromoPro	home goods	2
AdVantage	beauty products	1

SQL Solution

```
SELECT
    p.name,
    p.category,
    COUNT(r.product_id) AS total_requests
FROM products p
LEFT JOIN requests r
    ON p.id = r.product_id
WHERE p.is_available = 1
GROUP BY p.id, p.name, p.category
ORDER BY
    total_requests DESC,
    p.name ASC,
    p.category ASC;
```
